# Machine Theory of Mind (Deep Mind)

Helmut Wahanik

Waterloo Hydrogeologic Instituto Nacional de Matemática Pura e Aplicada, Rio de Janeiro - Brazil

#### IMPA – Rio de Janeiro

- -Research Dynamical Systems, Differential Geometry, Applied Mathematics.
- -2014 Fields Medal, Artur Avila, work in Dynamical Systems (Ten Martini Problem).

#### My work:

- -Mathematical Physics Fluid dynamics.
- -Riemann problems Numerical Shock Waves and Rarefactions waves in Gas Dynamics.
- -Markov Chain Monte-Carlo methods (Seismic Tomography) – SLB- U. of Cambridge.
- -Computational Geometry, U. of Calgary.

#### My work:

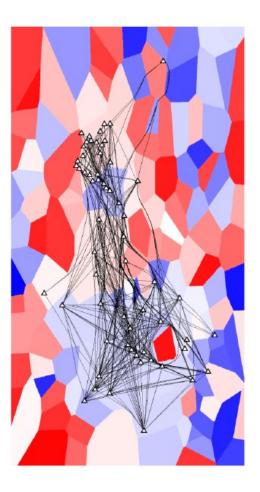

- -Mathematical Physics Fluid dynamics.
- -Riemann problems Numerical Shock Waves and Rarefactions waves in Gas Dynamics.
- -Markov Chain Monte-Carlo methods (Seismic Tomography) SLB- U. of Cambridge.
- -Computational Geometry, U. of Calgary.

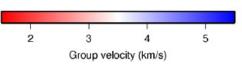

## Collaboration RJ-MCMC -University of Cambridge - UK (Schlumberger).

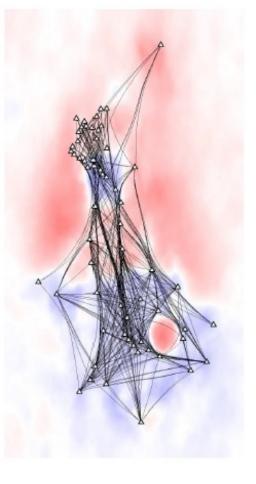

- -Travel-times built through Greens function approach and Seismic Ambient Noise.
- -Voronoi grids updated across the random walk.
- -Minimize difference of theoretical and experimental traveltimes.
- -Dimension is also variable, and adjust to complexity of the data.
- -Samples are accepted or rejected with a modified Metropolis-Hastings algorithm, guiding the samples towards regions of higher probability (e.g. Langevin MCMC MALA).

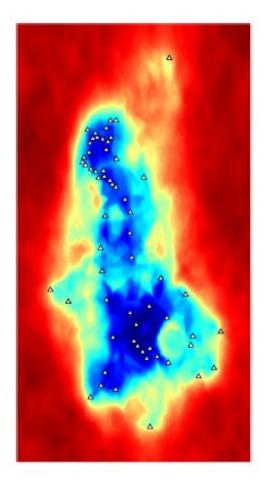

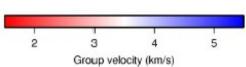

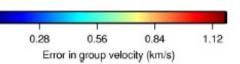

- -The 3D point-wise probability distribution across all chains is the final posterior => solution to inverse problem.
- -The uncertainty of the solution can be measured by the spread of the samples.
- -Fortran + OpenMPI + Qsub + SLB cluster.
- -Parallelization on calculation of seismic travel-times => many seismometers.
- -Mapping in GMT Generic Mapping Tools.

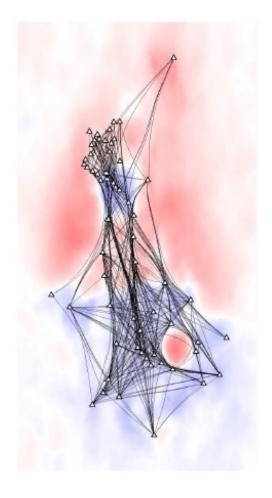

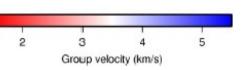

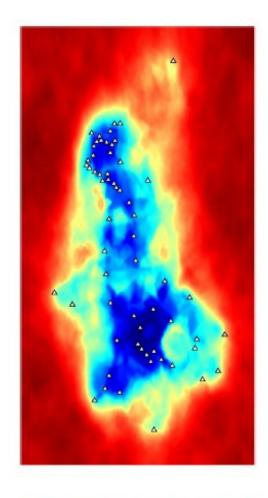

- -The 3D point-wise probability distribution across all chains is the final posterior => solution to inverse problem.

- -Mapping in GMT Generic Mapping Tools.

Could this be implemented in TensorFlow Probability?

## ToM-Net – Theory of Mind Neural Network

**Observer:** Uses Meta-learning to predict behaviors of agents living in a Grid-World (models other agents).

Objective: To rapidly form predictions about new agents from limited data and behavioral traces.

**Players:** Agents are themselves Deep Reinforcement Learning agents.

#### **Important Feature:**

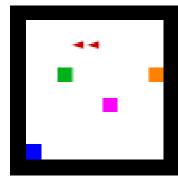

To imitate cognitive predictive patterns of human mind.

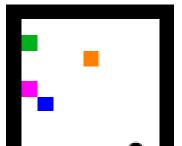

-Passes "cognition" tests such as the Sally-Anne test.

## Grid-world

partial past traj.

current state

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

3 year old child fails it.

4 year old passes it.

Sound-proof light-proof scent-proof barrier

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

-Measure of higher intelligence in primates:

3 year old child fails it.

4 year old passes it.

What's inside?

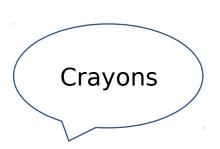

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

-Measure of higher intelligence in primates:

3 year old child fails it.

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

-Measure of higher intelligence in primates:

3 year old child fails it.

4 year old passes it.

Bones!

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

3 year old child fails it.

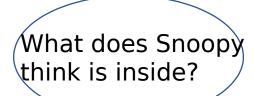

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

-Measure of higher intelligence in primates:

3 year old child fails it.

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

-Measure of higher intelligence in primates:

3 year old child fails it.

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

3 year old child fails it.

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

-Measure of higher intelligence in primates:

3 year old child fails it.

4 year old passes it.

Repeat first 3 steps with 4 year old

What does Snoopy think is inside?

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

-Measure of higher intelligence in primates:

3 year old child fails it.

-Developmental psychology test, for measuring a person's social cognitive intelligence: ability to recognize that others have false beliefs about the world.

3 year old child fails it.

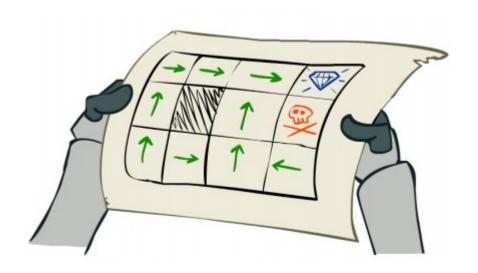

#### MDP: Augmented Markov Chain.

(UC) AhaT, R,  $\gamma$ ) such that:

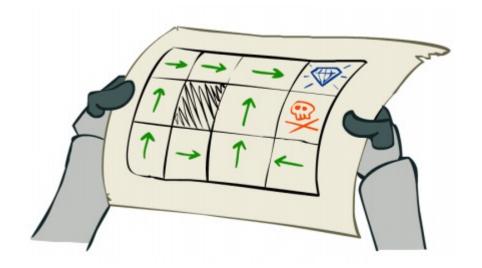

- Statemes
- set of actions available at s.
- $prob_t$  transition if using action  $a_t$  at  $s_t$

#### MDP: Augmented Markov Chain.

( $\mathfrak{S}^{h}$ Aha $T, R, \gamma$ ) such that:

- Statenes
- Set of actions et validable at s.
- prob transition if using action  $a_t$  at  $s_t$
- $\label{eq:continuous} \begin{tabular}{ll} & & & & & \\ & & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & & & \\ & & &$
- is a discount factor.

(Objective: Find optimal choice (policy)) pt actions all states testing the chain at any state. s.

Objective: We look for a policy m as imizing n that in the observable of the policy m as imizing n and n and n are n are n and n are n are n and n are n and n are n are n and n are n are n are n are n and n are n are n and n are n and n are n are n and n are n are n are n are n are n and n are n are n are n are n are n are n and n are n ar

Objective: We look for a policy maximizing that in sensitive of the content of t

Under policy, the expected average reward is recursively defined through: Under policy  $\pi$ , the expected average reward is recursively defined through:

$$V^{\pi}(s) := R(s, \pi(s)) + \gamma \sum_{s'} T_{\pi(s)}(s, s') V^{\pi}(s')$$

Objective: We look for a policy maximizing has inizing has inizengular disconnect was taken as S: V(s).

Under policy, the expected average reward is recursively defined through: Under policy  $\pi$ , the expected average reward is recursively defined through:

The optimal policy is derived from the Bellman Optimality Equation:  $(s, s') V^{\pi}(s')$  The optimal policy  $\pi^*$  is derived from the Bellman Optimality Equation:

$$V^*(s) := max_a \{ R(s,a) + \gamma \sum_{s'} T_a(s,s') V^*(s') \}$$

Objective: We look for a policy maximizing or the objective was agree was a state S: V(s).

Under policy, the expected average reward is recursively defined through: Under policy  $\pi$ , the expected average reward is recursively defined through:

The optimal policy is derived from the Bellman Optimality Equation:  $(s, s') V^{\pi}(s')$  The optimal policy  $\pi^*$  is derived from the Bellman Optimality Equation:

$$V^*(s) := max_a \{ R(s,a) + \gamma \sum_{s'} T_a(s,s') V^*(s') \}$$

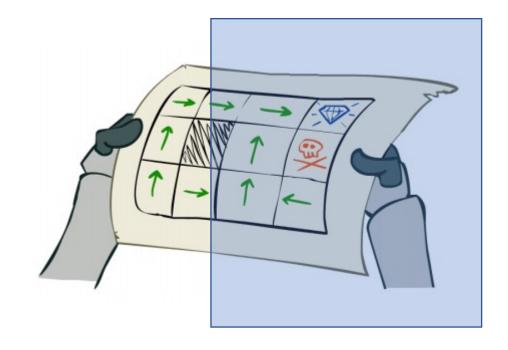

Argument contraction + fixed point theorem => there exists a unique solution to BOE.

Argument contraction + fixed point theorem => there exists a unique solution  $V^*$  to BOE.

# Partially Observable Markov Decision Process

( $\mathfrak{S}$ chAh $\mathfrak{A}$  $\mathfrak{T}$ , R,  $\mathfrak{O}$ ,  $\omega$ ,  $\gamma$ ) such that:

- Obsesemblens, o
- conditional padriaty ility of serventianisns, w.

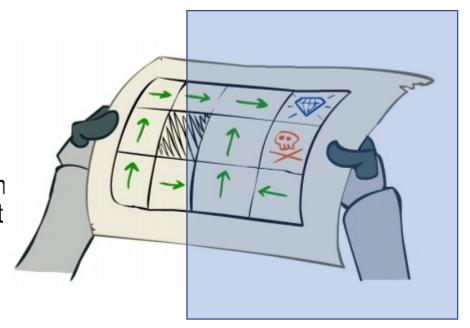

## Partially Observable Markov Decision Process

(UC)  $AhAR, R, O, \omega, \gamma$ ) such that:

- Obstations, o
- conditionational padriaty littly observation is ns, w.

Time, tif +afterif, sweerescenterobserveration is evidous perolation into Ageont, with uprobates it's beliefs b about current state.

## Partially Observable Markov Decision Process

( $\mathfrak{SC}$ )  $\mathfrak{A}$ ) such that:

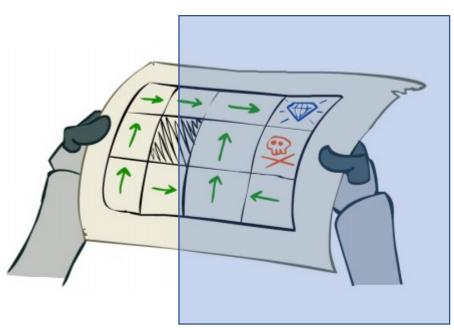

- Obsestations, o
- conditional parability lift observations, w.

Time, tif +afteif, swere ceitte rob, some reticeiv, evoiths produtability Agen, twith uprobates it is beliefs b about current state.

- the agent tries to infer the new state from observations & beliefs.

- Tom dest tries to infer the inew state from observations & liberiefs.

-POMDPS in MDPs observations equal true states, probability 1 -For POMDPS the Meta-learning process is evident: agent must learn how to update audients must learn provente tearning to be adverse in the probability to be stributions.

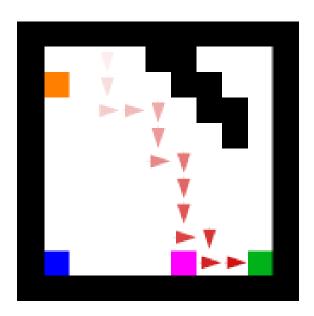

## The Machine Theory of Mind Architecture

Family of BOMS  $M = \bigcup_k M_k$ , Mazes (11x11), walls, 4 consumable objects.

•  $(S_k, A_k, T_k)$ 

# The Machine Theory of Mind Architecture

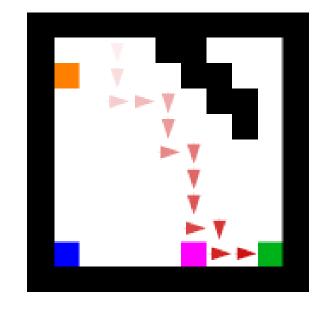

Family of  $BAMSM = \bigcup_j M_j$ , Mazes (11x11), walls, 4 consumable objects.

• 
$$(S_k, A_k, T_k)$$

#### Agents:

Recovered specifications, and policies are associated with  $Agent\ i$ 

- $(O_i, w_i, R_i, \gamma_i, \pi_i)$
- Policies might be stochastic, and non-optimal.

## The Machine Theory of Mind Architecture

Family of BOMS  $M = \bigcup_j M_j$ , Mazes (11x11), walls, 4 consumable objects.

•  $(S_k, A_k, T_k)$ 

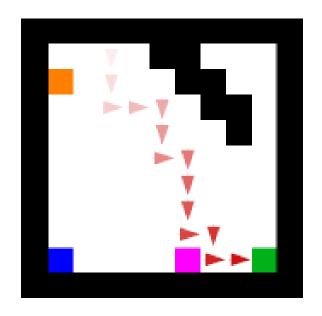

#### Agents:

Recovarious formations, and policies are associated with  $Agent\ i$ 

- $(O_i, w_i, R_i, \gamma_i, \pi_i)$
- Policies might be stochastic, and non-optimal.

#### CObserver ToMNet:

- •• State observation function:  $w^{(obs)}: S \rightarrow O^{obs}$
- Action observation function  $\alpha^{(obs)}\colon A \to A^{obs}$
- $w^{(obs)}(s) = s^{obs}$
- $\alpha^{(obs)}(a) = \alpha^{obs}$

#### Observer's Architecture

#### Training:

Observes a set after state of spart trajectories:

$$\left\{\tau_{ij}\right\}_{j=1}^{\text{Where}} \to \left\{\tau_{ij}^{(obs)}\right\}_{j=1}^{N_{past}}, \qquad \text{where} \qquad \tau_{ij}^{(obs)} = \left\{(s_t^{(obs)}, a_t^{(obs)})\right\}_{t=0}^{T}$$

#### Observer's Architecture

#### Training:

Observes a set after state of spart trajectories:

$$\left\{\tau_{ij}\right\}_{j=1}^{\text{Where}} \to \left\{\tau_{ij}^{(obs)}\right\}_{j=1}^{N_{past}}, \qquad \text{where} \qquad \tau_{ij}^{(obs)} = \left\{(s_t^{(obs)}, a_t^{(obs)})\right\}_{t=0}^{T}$$

- Here is a tensor of size 11 x 11 x K.
- KHEVERLUTE Plantes, tenspersonalise of jets, 1 agent.
- K feature planes, such as walls, objects, agent.

#### Observer's Architecture

#### Training:

Observes a set after state of spart trajectories:

$$\left\{\tau_{ij}\right\}_{j=1}^{\text{Where}} \to \left\{\tau_{ij}^{(obs)}\right\}_{j=1}^{N_{past}}, \qquad \text{where} \qquad \tau_{ij}^{(obs)} = \left\{(s_t^{(obs)}, a_t^{(obs)})\right\}_{t=0}^{T}$$

- Here is a **tensor of size** 11 x 11 x K.
- KHERETURE Plantes, tenspasowalke objects, lay but.
- K feature planes, such as walls, objects, agent.
- Also dimension 5 logit, fully characterizing the action: Also  $a_i^{(b)}$  is a dimension 5 logit, fully characterizing the action:  $[\cdot, \downarrow, \rightarrow, \uparrow, \leftarrow]$  The trajectory is a tensor is of size 11x11x ( K + 5 ). The trajectory  $\tau_{ij}^{(obs)}$  is a tensor is of size 11x11x ( K + 5 ).

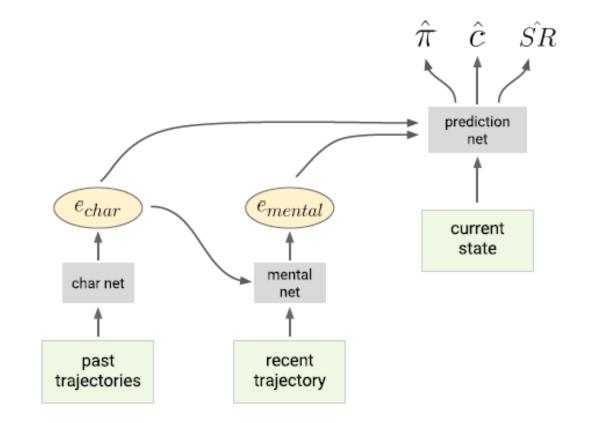

#### Observer's Neural Net

Character Net: Characterizes the past  $\{\tau_{ij}^{(obs)}\}_{j=1}^{N_{past}}$  (2D Tensor) $_{\theta}$ 

For all agents iwe add:  $e_{char,ij}$  (2D Tensor)

For all agents we add:

$$e_{char,i} = \sum_{j=1}^{N_{past}} e_{char,ij}$$

## Observer's Neural Net

Character Net: Characterizes the past  $\{\tau_{ij}^{(obs)}\}_{j=1}^{N_{past}}$  (2D Tensor)

For all agents iwe add:  $e_{char,ij}$  (2D Tensor)

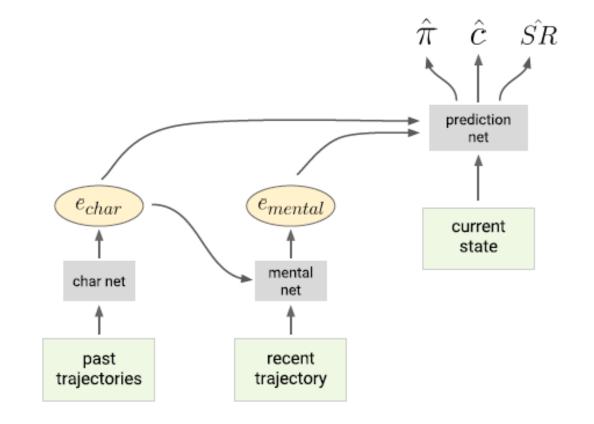

For all agents we add:

$$e_{char,i} = \sum_{j=1}^{N_{past}} e_{char,ij}$$

Mental Net: Mentalizes about the CURRENT EPISODE

Mental Net: Mentalizes about the CURRENT EPISODE

$$[\tau_{ij}]_{0:t-1}, e_{char,i} \xrightarrow{g_{\theta}} e_{mental,i}$$

## Observer's Neural Net

Character Net: Characterizes the past  $\{\tau_{ij}^{(obs)}\}_{j=1}^{N_{past}}$  (2D Tensor)

For all agents iwe add:  $e_{char,ij}$  (2D Tensor)

For all agents we add:

$$e_{char,i} = \sum_{j=1}^{N_{past}} e_{char,ij}$$

Mental Net: Mentalizes about the CURRENT EPISODE

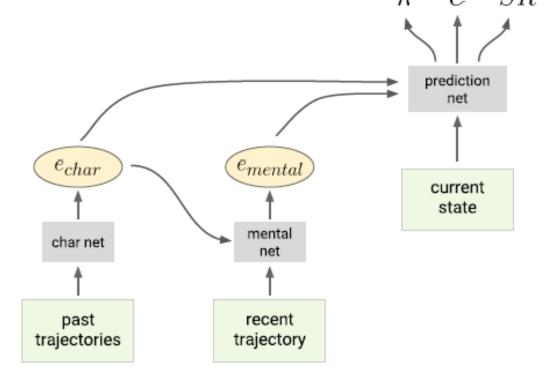

Mental Net: Mentalizes about the CURRENT EPISODE

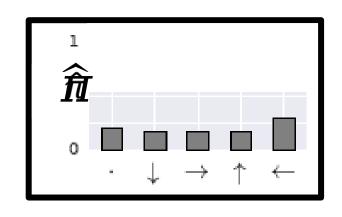

Prediction Net:  $e_{\text{turrent}} e_{\text{ther}} + i \xrightarrow{g_{\theta}} e_{\text{ther}} e_{\text{the$ 

Predicted policy:

Prediction Webility of representations and the stimate:

- Predicted policy:  $\hat{\pi}(\;\cdot\;\mid\;s_t^{(obs)}$  ,  $e_{char}$  ,  $e_{mental}$  )
- Probability of consuming an object ĉ

### **Experiments**

### Frully Francism aggents

- Species of a bents.

- 5B stochhaiticher lieution:  $\pi_i$   $\pi_i$  Dirichlet distribution: Species can be written as  $S(\alpha)$ .
   For  $\alpha$  one-sided deterministic policies.  $\alpha$  uniform distribution.

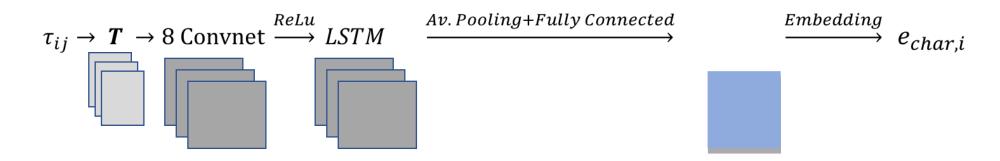

### Training

- Observe sample from species sturning in Grid Worlds.
- A set of recent trajectories, with  $\sim U\{0, 10\}$ . Length of trajectory = 1.
- Adam optimizer AOK, Minimatcheres frize 16.

### Architecture

### Random agent Training

### Random agent Training

- -Townhet test imates increase with the number of past observations of that action!
- in the reliving of the distriction of the distric

# Inferring goal-directed behaviour

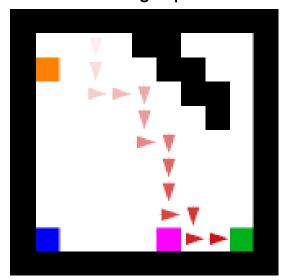

TPMMettleernstwinfergodsoffewardseekingagents.

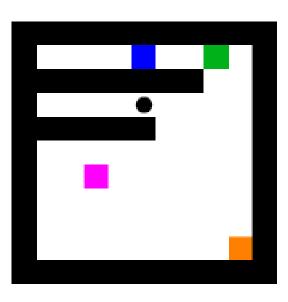

- **-**44consumable objects.
- Assent has a sew as what the tripotion: when consuming an object.
- **-**-0,011fe/revery/maye.
- Frendaty of 10055 for walking into walks.
- Agentifinds opatimal popilicy reprotugated and mean agreement on.

**Training:** ToMNet observes a single full trajectory of an agent acting on the Grid-World. **Training:** ToMNet observes a single full trajectory of an agent acting on the Grid-World.

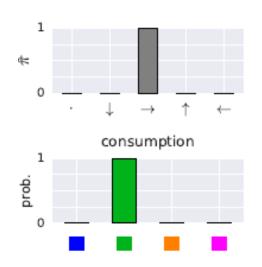

# Inferring goal-directed behaviour

Observe single past MDP

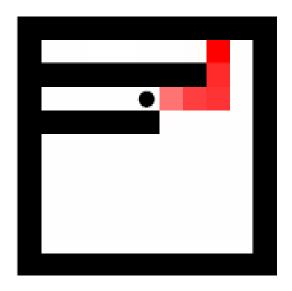

**Current state** 

ToMNet prediction of next action

#### Prediction of successive states

### ToMNet vs Sally-Anne Test

ToMNet must pass the Sally-Anne test!

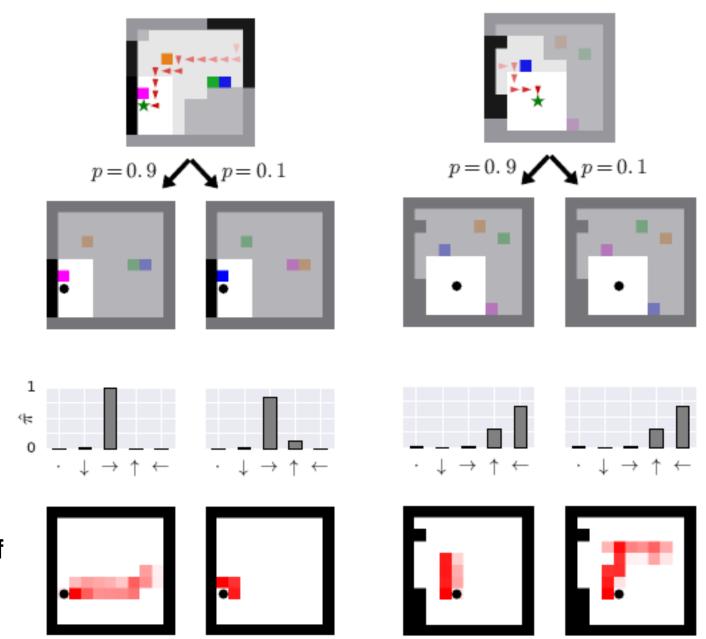

- Create POMDPs, agents 5 x 5 visibility window, where agents have false beliefs.
- We run random changes in the environment that are invisible to the agent.
  - Agent has a goal and a sub-goal.
- When obtaining the sub-goal => swap the remaining objects, with low probability.

# Acting on false beliefs: Preliminaries

- Sub-goal: star. Goal: blue object.
- Dark grey => not observed.
- Light grey => observed before but NOT during goal consumption.
- Consumption => p=0.01 of swap event
- Observe Effect of swap in agent's policies and expected future moves.

# Acting on false beliefs: Preliminaries

- Sub-goal: star. Goal: blue object.
- Dark grey => not observed.
- Light grey => observed before but NOT during goal consumption.
- Consumption => p=0.01 of swap event
- Observe effect of swap in agent's policies and expected future moves.
- Left: Swap event within field of view.
- Right: Swap event outside of field of view.

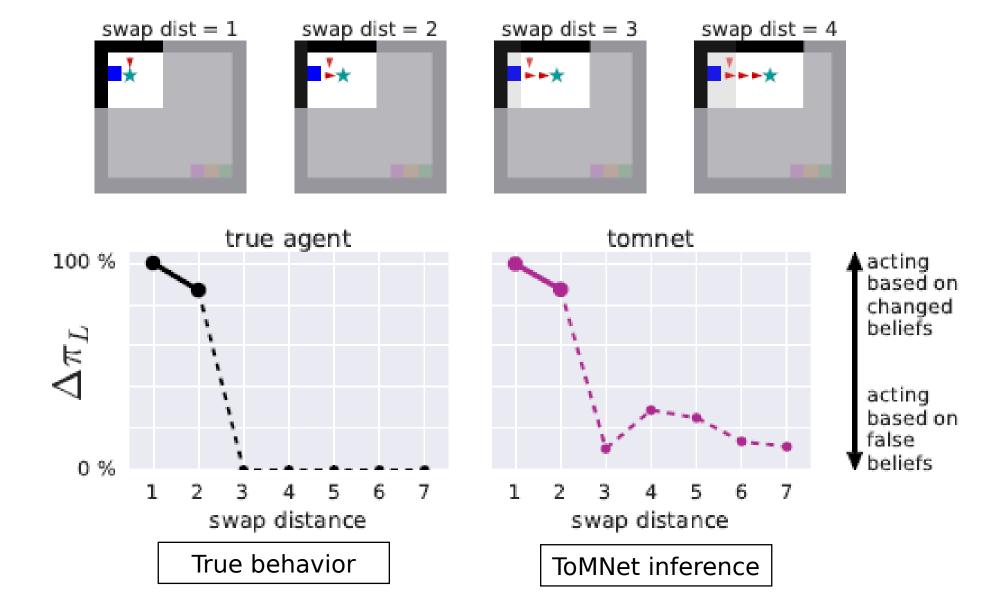

### Running the Sally-Anne Test

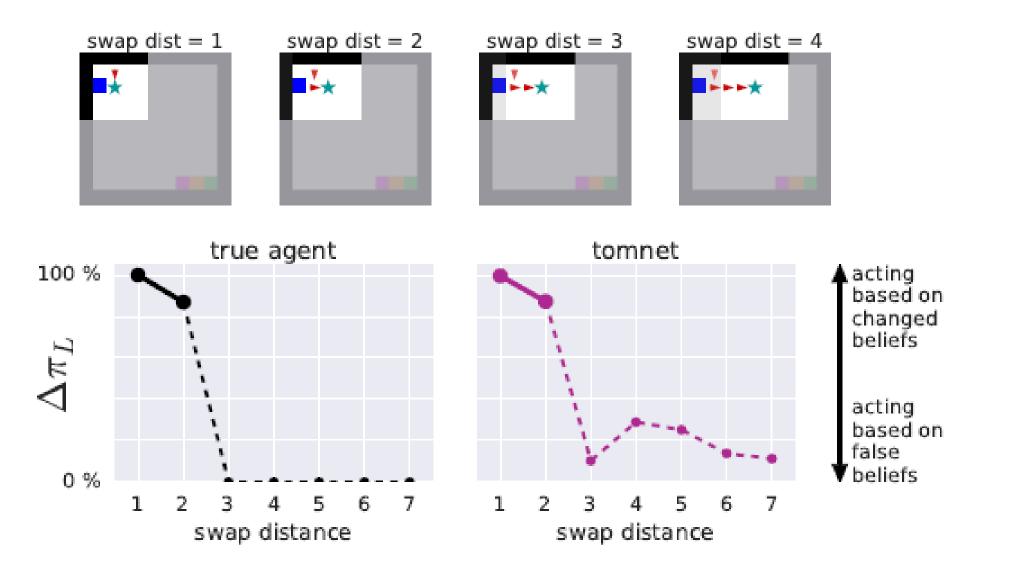

- Agenthas 5 x 5 window, consume star (sub-goal), prefers blue object.
- -Ifweinceesedistencetoswap, it may be invisible.
- Agentispolicy unchanged for invisible swap.

$$\Delta \pi_L = \frac{\pi(a_L \mid no \ swap) - \pi(a_l \mid swap)}{\pi(a_L \mid no \ swap)} * 100\%$$

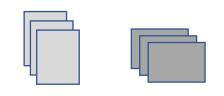

### Running the Sally-Anne Test

### Runningthe Sally-Anne Test +passes! Told Vetyeat gratique lo

### **Architecture**

- ConvNet + LSTM Charaster West. ConvNet + LSTM
- Mental State: Nobre.
- Prediction Net:
  - Three-predictions swith share to repeat
    - Polify/Predigition: <u>ConvNet</u> ConvNet
    - Probability Consumption Replication: Convolet
    - Successor Representation: ConvNetonvNet
- DeeppRLAgents: UNIREAA brachiteitectere 10000 Missoises les justes tes COCPU
- Belief-Prediction-Head:
  - ConvNet 11x11x11x5 Dim Logit predicted belief objects present on map.
    ConvNet ⇒ 11x11x5 Dim Logit predicted belief objects absent from map.

## THANK YOU
